Robots Module: Extraction & Curation Guidelines

Objective

We are **not building a database of every robot on the internet**.

For the first version of AIOrbit, the target is **up to 1,000 of the best AI/robotic systems globally**.

Interns may need to discover and review **10,000–20,000+ robots** across the internet, but only the **highest-quality, relevant and verifiable robots** should make it into AIOrbit.

> **Discover broadly → verify → score → remove duplicates → keep only the best.**

---

1. Primary Discovery Sources

Source 1 — There's An AI For That

https://theresanaiforthat.com/robots/

Start here and systematically review the available robots and categories.

Source 2 — Robot Observatory

https://robotobservatory.com/robots

Use this as a second structured discovery/validation source. It maintains a robot database with evidence/status labels and covers robots across factories, warehouses, farms, hospitals and other environments. ([Robot Observatory](https://robotobservatory.com/robots))

Then expand

Search the broader internet through:

- Official robot/manufacturer websites
- Robotics company websites

- GitHub
- Research labs/universities
- Robotics industry databases
- Credible robotics publications
- Robot-specific directories
- Recent robotics announcements

Important: These sources are for discovery. **The manufacturer's official website should be used to verify the actual robot and its specifications.**

---

2. What Robots Should We Include?

Prioritize robots that are **real, meaningful, currently relevant and demonstrably capable**.

Focus on:

- Humanoid robots
- Industrial robots
- Service robots
- Healthcare robots
- Agricultural robots
- Autonomous mobile robots
- Drones
- Robot dogs
- Companion robots
- Research robots
- Warehouse/logistics robots
- Task-specific robots
- Autonomous robots
- Multi-agent robotic systems

Strong preference for:

Currently available/deployed + technically capable + actively developed + meaningful real-world use.

A robot does **not** need to be commercially available to qualify. A significant research robot can be included if it is genuinely important and technically noteworthy.

---

3. Reject Low-Quality Candidates

Do not include:

- Fake/unverifiable robots
- Concept-only announcements with no meaningful evidence
- Dead/discontinued products unless historically important
- Duplicate models
- Minor revisions incorrectly listed as separate robots
- Generic robotics projects with no meaningful product
- Poor-quality prototypes with no useful capability
- Robots with completely unverifiable specifications

Be particularly careful with **new humanoid robot announcements**. The robotics industry has many demonstrations and announced products that have not reached meaningful deployment. Recent research also notes the gap between demonstrations, pilots and widespread real-world deployment. (Stanford HAI)

---

4. How to Select the Best Robots

When there are 20 robots performing the same type of task, **do not add all 20 automatically**.

Compare them and select the strongest.

Use this **100-point scoring system**:

Factor	Weight
Capability / Performance	**25**
Real-world usefulness	**20**
Deployment / Availability	**15**
Technical maturity	**15**
Adoption / Traction	**10**
Recency / Development activity	**5**
Documentation / Verified specifications	**5**

Differentiation	**5**
Total	**100**

Ranking

90–100 → **Exceptional** — Must strongly consider
80–89 → **Excellent** — Include
70–79 → **Good** — Include selectively
60–69 → **Average** — Usually skip
<60 → **Reject**

Most important

Do **not** rank a robot highly just because:

- It is new
- It has received large funding
- It went viral
- The company made impressive videos
- It is humanoid
- It has a famous manufacturer

Actual capability and real-world evidence matter more.

---

5. Deployment Is a Major Signal

Distinguish clearly between:

Concept → **Prototype** → **Research** → **Pilot** → **Pre-order** → **Commercial** → **Deployed**

A robot already performing useful work in a warehouse, hospital, factory, farm, etc. should generally rank above an impressive demonstration with no deployment evidence.

For example, current robotics directories increasingly distinguish availability and deployment status rather than treating every announced robot equally. (Which Humanoid)

---

6. Duplicate Handling

This is extremely important.

The same robot may appear under:

- Different websites
- Different spellings
- Different generations
- Different regional names
- Manufacturer + reseller listings

Before creating a record, compare:

Robot name + manufacturer + official URL + model number + generation

Same robot

→ ONE AIOrbit record

New generation with materially different hardware/capabilities

→ Separate record **only if it is genuinely a distinct product/model**.

Do not create separate records simply because a robot has different software versions, marketing names or regional listings.

---

7. Data to Extract

For every selected robot, collect:

Basic

- Robot name
- Manufacturer/company
- Official website
- Official product URL
- Robot type
- Category/subcategory
- Description
- Launch/release year
- Current status

Capabilities

- Primary use case
- Secondary use cases
- Autonomy level
- AI capabilities
- Navigation
- Manipulation
- Computer vision/sensors
- Human interaction
- Key tasks

Hardware

- Height
- Weight
- Payload
- Battery/runtime
- Speed
- Degrees of freedom
- Sensors
- Mobility type
- Important hardware specifications

Commercial

- Price, if public
- Availability
- Shipping/deployment status
- Pre-order status
- Enterprise/research availability

Company & verification

- Company
- Country
- Official documentation
- GitHub, where applicable
- Official social links
- Source(s)
- Quality score
- Last verified date

Do not invent missing specifications. If the manufacturer does not publish a specification, mark it as **Not publicly disclosed**.

---

8. Final Rule

The workflow for interns is:

There's An AI For That → Robot Observatory → Search wider → Official manufacturer verification → Remove duplicates → Score → Compare similar robots → Select best

You may discover **10,000–20,000+ robots**.

But AIOrbit should contain **no more than ~1,000 initially**.

> **We want the 1,000 robots worth knowing about — not 1,000 random robots.**

If only 700 meet the quality threshold, publish 700. **Never lower the quality bar just to reach 1,000.**
