

Agents Module Extraction Guidelines

1. Objective

We are **not trying to collect every AI agent available on the internet**.

The goal is to build a **high-quality, actively maintained AI Agents database**.

Prioritize agents that are:

- Actually functional and available to users
- Recently launched or recently updated
- Actively maintained
- Getting meaningful adoption/attention
- Solving a real workflow or business problem
- Clearly agentic — capable of executing tasks/workflows, not just being a basic chatbot
- Useful enough that someone would genuinely want to discover and use them

Quality > quantity.

2. Primary source — Creati.ai

The **first and primary discovery source must be Creati.ai's AI Agents directory**:

[Creati.ai — AI Agents](#)

Use it as the **starting point for agent discovery**. Creati.ai currently indexes thousands of AI agents and organizes them across categories such as general-purpose assistants, workflow automation, coding, research, sales, customer service, etc. ([Creati.ai](#))

The team should **first extract the strongest and most relevant agents from this source**, rather than randomly searching the web.

3. Other sources for discovery

After Creati.ai, use additional **AI-focused sources** for discovering and validating agents.

Priority:

1. **Creati.ai — AI Agents**
2. **Futurepedia / AI-agent-related listings**
3. AI-specific directories and agent marketplaces
4. Product Hunt — newly launched AI agents
5. GitHub — active/open-source agents
6. Official company/product websites
7. AI startup databases
8. AI newsletters and launch lists
9. TechCrunch / major AI publications for significant launches
10. Reddit/community discussions for discovering genuinely popular agents

Futurepedia, for example, maintains an AI-focused directory covering business, productivity, workflow automation and other AI categories. ([futurepedia](#))

Do not use generic databases as the primary source.

4. Recency is extremely important

For every agent, check **when it was launched or substantially updated**.

Priority 1 — Recently launched

Give the highest priority to agents launched within the **last few months**.

These should be actively surfaced because the Agents ecosystem changes extremely quickly.

Priority 2 — Older but still active

An agent launched 6–12+ months ago can absolutely be included if:

- It is still active
- The product is maintained
- It has meaningful users/adoption
- It continues receiving updates
- It remains relevant
- It has strong reputation/traction

Exclude

Do not include agents that are:

- Dead

- Abandoned
 - No longer accessible
 - Permanently shut down
 - Clearly outdated
 - Just an old landing page
 - No longer maintained
 - Listed only because they existed historically
-

5. What qualifies as an "Agent"?

Don't classify every AI tool as an agent.

A strong agent should generally be capable of **taking actions or executing a multi-step task/workflow**, rather than simply generating a response.

Examples of strong agent characteristics:

- Can plan and execute tasks
- Can use external tools
- Can interact with websites/apps
- Can perform multi-step workflows
- Can operate autonomously or semi-autonomously
- Can monitor something and take action
- Can execute coding tasks
- Can conduct research and produce results
- Can act as a digital worker
- Can operate across multiple applications

A basic:

"AI image generator"

should generally remain a **Tool**, not an Agent.

But:

"AI agent that researches competitors, collects information, analyzes it and produces a report"

is much more appropriate for the **Agents** module.

6. Focus on useful agents

We don't need thousands of low-quality agents just to increase the count.

Prioritize:

Business Automation → Coding → Research → Customer Support → Sales → Marketing → Data Analysis → Knowledge Management → Personal Productivity → Workflow Automation → Autonomous Agents

The existing category structure in the UI is a good starting point for classification.

Creaiti.ai itself currently uses categories spanning workflow automation, digital workers, general-purpose assistants, coding assistance, research, data analysis, sales, marketing and other specialized areas. ([Creaiti.ai](#))

7. Required data for every agent

At minimum, extract:

- Agent name
- Official website
- Description
- Category
- Subcategory
- Company/creator
- Launch date
- Last updated date, if available
- Pricing
- Free / Freemium / Paid
- Platform
- API availability
- Open-source status
- Supported models
- Integrations
- Primary use case
- Country/company information where available
- Official social links
- GitHub repository where applicable

And importantly:

Active / Inactive status

This allows us to continuously remove or deprioritize dead agents.

8. Verification rule

For every agent discovered through a directory:

Directory → Official website → Verify

Do not blindly copy the directory's information.

The official website should be used to confirm:

- The agent actually exists
 - It is currently available
 - What it actually does
 - Pricing
 - Product capabilities
 - Company/creator
 - Current status
-

9. Don't inflate the database

We should **not have a target like "collect 10,000 agents no matter what."**

If we find:

3,000 excellent agents → stop.

That's better than:

10,000 agents containing thousands of dead, duplicate or useless products.

The objective is to make AIOorbit the place where someone can discover **the best active AI agents**, not the place with the largest number of scraped records.

10. Deduplication

Agents will frequently appear under multiple names/sources.

Use:

Official product URL + domain + company + product name

to identify duplicates.

For example, if the same agent appears on:

- Creati.ai
- Futurepedia
- Product Hunt
- GitHub
- the company's website

it should become **one AIOrbit agent**, with the different sources used for enrichment/verification.

Final instruction to the team

Start with Creati.ai's AI Agents directory as the primary discovery source. Extract the highest-quality, active and relevant agents first. Prioritize agents launched in the last few months, but also include older agents that remain highly active, maintained and widely used. Use other AI-specific directories, Product Hunt, GitHub, official websites and credible AI publications for additional discovery and validation. Do not try to collect every agent on the internet. Do not fill the database with inactive, duplicate, low-quality or barely useful agents just to increase the count. The goal is a high-quality, current and useful AI Agents database — quality and activity first, quantity second.
