

Devices Module: Extraction & Curation Guidelines

Objective

We are **not building a database of every hardware product that contains AI**.

For the first version of AIObit, we want **up to 1,000 of the best AI-enabled devices globally**.

Interns should discover **10,000–30,000+ devices**, evaluate them, remove duplicates and weak products, and finally select only the **best ~1,000**.

Discover broadly. Curate aggressively. Quality > Quantity.

1. What Kind of Devices Are We Looking For?

The scope should follow the type of AI hardware represented by the reference directory:

- **AI PCs / Laptops**
- **Smartphones**
- **Smart Home**
- **Wearables**
- **AI Cameras**
- **Audio / AI Audio**
- **AR / VR / Spatial Computing**
- **Edge AI Hardware**
- **Robotics Hardware**
- **Medical AI Devices**
- **Development Boards**
- **Smart Sensors**
- **Automotive AI Devices**
- **Microphones / Voice Devices**
- **Agricultural AI Devices**
- **Other genuinely AI-enabled physical devices**

The key requirement is:

AI must be a meaningful part of the device's functionality — not merely a marketing label.

For example, an ordinary laptop should not be included simply because it has an "AI" sticker. An AI PC with meaningful on-device inference/NPU capabilities and AI-specific functionality can qualify.

2. Discovery Sources

Primary Source

There's An AI For That — Devices

<https://theresanaiforthat.com/devices/>

Use this as the **starting point** and systematically extract relevant devices.

Secondary Discovery Source

Physical AI Devices

<https://physicalaidevices.com/>

This is useful for discovering physical AI hardware across areas such as AI cameras, wearables, spatial computers, edge hardware and robotics. Its directory currently covers hundreds of physical AI devices. ([Physical AI Devices](#))

Then expand through:

- Official manufacturer websites
- CES / major technology exhibitions
- Product Hunt
- Major technology publications
- Hardware databases
- GitHub, where relevant
- Credible industry databases
- Regional technology/product directories

Important: Discovery sources are not sufficient for verification.

Use:

3. What Should Be Included?

Prioritize devices that are:

- Actually available or meaningfully announced
- Currently relevant
- Technically interesting
- Useful to consumers, developers or businesses
- AI-native or meaningfully AI-enabled
- From credible manufacturers/startups
- Actively supported
- Clearly documented

Give additional priority to:

New + innovative + commercially available + useful + strong adoption

But an older device can remain if it is still important, supported and useful.

4. What Should Be Rejected?

Do **not** include:

- Fake/unverifiable products
- Concept renders with no credible product evidence
- Dead/discontinued devices
- Ordinary hardware with superficial "AI" marketing
- Duplicate products
- Different storage/RAM/color variants
- Regional listings of the same device
- Generic components that have no meaningful AI relevance
- Poor-quality or irrelevant hardware

Very important

Do not create separate records for:

Same laptop — 16GB vs 32GB

Same phone — different storage

Same camera — different regional SKU

Same device — different retailer

These are **one device**.

5. How to Select the Best Devices

When you find 20 similar products, **compare them instead of adding all 20**.

Use this simple **100-point score**:

Factor	Weight
AI capability & usefulness	25
Product quality	20
Real-world utility	15
Availability / maturity	15
Adoption / market traction	10
Innovation / differentiation	5
Recency / active development	5
Quality of verified information	5
Total	100

Ranking

90–100 → Exceptional

Strongly prioritize.

80–89 → Excellent

Include.

70–79 → Good

Include selectively.

60–69 → Average

Usually skip.

<60 → Reject.

Do not rank based only on popularity.

A viral device is not automatically a good device.

Look at **actual functionality, availability, user value and evidence.**

6. Verify Every Device

Before adding a device, verify it from the **official manufacturer/product page.**

Confirm:

- Device actually exists
- Correct product name
- Manufacturer
- Release date
- AI functionality
- Specifications
- Availability
- Price, if publicly available
- Current status

If a specification cannot be verified:

Do not guess.

Mark it as **Not publicly disclosed.**

7. Deduplication

This will be one of the biggest problems.

Before creating a device, compare:

Product name + manufacturer + official URL + model number + generation

The same device may appear on:

- There's An AI For That
- Physical AI directories
- Amazon
- Product Hunt
- Manufacturer website
- News articles
- Multiple regional websites

These should produce **ONE AIOorbit device record**.

Retailers and directories are sources, **not separate devices**.

8. Data to Extract

For every selected device:

Basic

- Device name
- Company/manufacturer
- Official website
- Official product URL
- Category
- Subcategory
- Country
- Description
- Release date
- Current availability/status

Product

- Main AI capability
- Primary task/use case
- Key features
- AI model/technology, if publicly disclosed
- Connectivity

- Platform/OS
- Important hardware specifications

Commercial

- Price
- Availability
- Regions supported
- Pre-order / shipping / discontinued status

Verification

- Official source
 - Secondary source
 - Last verified date
 - AIOrbis quality score
 - Notes
-

Final Rule

The intern workflow should be:

There's An AI For That → Physical AI Devices → Search wider → Official manufacturer verification → Remove duplicates → Score → Compare similar devices → Select the best

We may discover **10,000–30,000+ devices**, but AIOrbis should initially contain **no more than ~1,000 high-quality devices**.

Do not try to reach 1,000. Try to find the best 1,000.

If only 700 devices meet the quality bar, **publish 700 rather than lowering the standard**.
